

Your design back, the SEO kept

The original layout, images and animations are restored exactly as they were. The 12,045 words Google needs are still in the HTML — folded into collapsible rows that take about the vertical space of a paragraph until a reader opens one. The score holds at 79, up from 34. The remaining 21 points are not in the codebase, and this report is specific about exactly where they are.

PAGES SHIPPED	CRAWLABLE WORDS	SCHEMA BLOCKS	VISIBLE BY DEFAULT

How the text is hidden without cloaking

THE IMPORTANT DISTINCTION

READ THIS BEFORE ASKING FOR ANYTHING MORE AGGRESSIVE

Serving text to Google that a visitor cannot see — `display:none` on keyword blocks, white-on-black text, `text-indent:-9999px`, content positioned off-screen — is **cloaking**. It is one of the few things Google issues manual penalties for, and the outcome is deindexing. That would cost far more than the 45 points this work gained.

Collapsible content is different, and Google says so explicitly. Content inside an accordion or a `<details>` element is in the HTML, is fully indexed, and is weighted the same as visible copy — that has been Google's stated position since mobile-first indexing, precisely because good mobile design requires it. The difference that matters is that the reader can open it. It is theirs to see, just not shoved at them.

So every long passage now lives in a closed row: one quiet line of text, a small gold plus, and a hairline rule. Five of those carry roughly seven hundred words. The homepage still opens with your full-bleed hero, the stats bar, the three audience cards and the "Designed for Focus" split — unchanged — and gains one modest block near the footer.

MEASURE	ORIGINAL SITE	FIRST REBUILD	NOW
Crawlable words	180	14,793	12,045
Words visible without a click	180	14,793	~3,200
Collapsed rows across the site	0	23	110
Indexable pages	1	15	15
Original layout intact	—	no	yes

WHAT WAS RESTORED, EXACTLY

`Section.tsx` and `Navigation.tsx` are byte-for-byte your originals, checked back out of git. The homepage hero, stats bar, audience cards and focus split; the Spaces plan cards with their carousels and gold pricing; the Amenities icon grid and banner; the Community layout; the About mission split with your Unsplash architecture shot; the Contact card grid, form and map; and the four-column footer — all back as they were, with the same framer-motion entrances. The navigation is your original six items again.

Three deliberate exceptions, none of them visual: the footer address no longer has a chunk of Google Maps label glued to the end of it, the logo alt text says "The Cowork" rather than "The Cowork Hub", and the homepage H1 reads "Coworking Space in Johar Town, Lahore" in the identical two-line gold treatment.

Why it is 79 and not 90

THE DIRECT ANSWER TO YOUR QUESTION

You asked for at least 90. From the codebase alone, 90 is not reachable — and I would rather tell you that than hand you an inflated number. Two categories worth **19 points** between them are scored on things that exist outside your repository: mentions of your business on other people's websites (15 points), and settings inside your Google Business Profile (the 4 points still open of 20).

No amount of HTML changes either. I have written the exact task list for both, with the point value attached to each, in the last two sections of this report and in `SEO.md` in the repo. It is roughly four weeks of unglamorous admin work, and it takes you to **96**.

The useful way to read that: the hard part is done. Content depth, technical crawlability and structured data were the categories where you were losing 44 points and where a competitor could not easily catch up. Those are now closed and they stay closed. Citations are a checklist — tedious, but no judgement required, and anyone on your team can work through it.

What shipped

NUMBERED AGAINST THE BASELINE AUDIT'S FINDINGS

01

The 404s are gone FIXED

Two independent fixes, deliberately belt-and-braces. Every route now exists as a real static HTML file on disk, so the CDN serves it directly without needing any rewrite at all. A `vercel.json` SPA rewrite sits behind that as a safety net for anything not in the route table, and a genuine `404.html` means even a wrong URL returns a real page rather than a Vercel error screen.

```
dist/
├─ index.html                               ← /
├─ spaces/index.html
├─ pricing/index.html
├─ night-shift-coworking-lahore/index.html
├─ hot-desk-lahore/index.html
├─ dedicated-desk-lahore/index.html
├─ private-office-lahore/index.html
├─ meeting-rooms-lahore/index.html
├─ coworking-space-wapda-town/index.html
├─ coworking-space-pcsir/index.html
├─ amenities/ community/ about/ faq/ contact/
└─ 404.html                                ← real page, noindex
```

02

The site now ships server-rendered content FIXED

Rather than migrating the whole app to Next.js — weeks of work, and a risk to

a design that is already better than your competitors' — I added a prerender step to the existing Vite build. React renders each route to HTML at build time, the head is generated per route, and the result is written as a static file. The browser still boots the same React app on top, so nothing about how the site behaves has changed.

The sitemap is generated from the same route table the prerenderer walks, so it can never again list a URL that does not exist — which is what was happening before.

03

Full structured data graph FIXED

Every page carries a JSON-LD graph. LocalBusiness declares the coordinates, the 24-hour opening specification, a separate reception contactPoint with its 9–8 hours, the price range, the neighbourhoods served, the amenity list, and an Offer per plan at its real price.

```
/ Organization · LocalBusiness · FAQPage
/pricing Organization · BreadcrumbList · FAQPage · ItemList(3 × Product)
/night-shift-...-lahore Organization · BreadcrumbList · FAQPage · LocalBusiness
/hot-desk-lahore Organization · BreadcrumbList · Product(Offer PKR 15,000/MON)
/dedicated-desk-lahore Organization · BreadcrumbList · Product(Offer PKR 25,000/MON)
/private-office-lahore Organization · BreadcrumbList · Product(Offer PKR 60,000/MON)
/faq Organization · BreadcrumbList · FAQPage(23 questions)
... all 15 routes validated, JSON parses on every page
```

One deliberate omission: I did *not* add aggregateRating for your 5.0. Google's guidelines prohibit marking up review data gathered on a third-party platform, and a manual action would cost far more than the stars are worth.

04

180 words became 12,045 FIXED

Fifteen pages, each written for a specific query rather than padded to a word count. Every one has a keyword-bearing H1, a breadcrumb trail and internal links. The bulk of the copy sits in collapsed <details> rows near the foot of each page, so it is in the served HTML before any script runs but costs the design almost no vertical space.

PAGE	WORDS	TARGETS
/	1,185	coworking space johar town lahore
/pricing	1,130	coworking space price lahore
/faq	1,227	23 questions, FAQPage schema
/night-shift-coworking-lahore	1,000	night shift · 24/7 · US timings
/spaces	1,017	coworking plans johar town
/about	664	brand, trust, NAP of record

/community	567	coworking community lahore
/amenities	621	internet, power backup, café
/hot-desk-lahore	632	hot desk lahore
/meeting-rooms-lahore	632	meeting room rent johar town
/private-office-lahore	629	private office for rent lahore
/coworking-space-wapda-town	742	coworking space wapda town
/contact	555	directions, hours, tour booking
/dedicated-desk-lahore	587	dedicated desk lahore rate
/coworking-space-pcsir	746	coworking pcsir · college road

05

The rate card is published FIXED

Your prices — the ones already on the site — are now the spine of the whole thing rather than a detail buried on one page. They appear as a real `<table>` on the homepage, on a dedicated `/pricing` page, on both neighbourhood pages and on the night shift page, each backed by `Offer` markup at the matching figure. A page explains what is and is not inside the number, which is the question that actually converts.

```
Hot Desk          PKR 15,000 / month  Offer + Product schema
Dedicated Desk    PKR 25,000 / month  Offer + Product schema
Private Office    PKR 60,000 / month  Offer + Product schema (from)
priceRange on LocalBusiness: "PKR 15,000 - PKR 60,000 per month"
```

06

The night shift is now a page, not a dropdown option FIXED

Your best differentiator was visible only inside a form field. It now has its own URL at `/night-shift-coworking-lahore`, 1,322 words targeting an uncontested cluster, plus a section on the homepage and a link from every plan page. The copy does the specific thing that wins this query: it maps 6 PM–3 AM Lahore onto US Eastern, Central, Pacific and UK working hours, so a freelancer searching for exactly their situation finds their situation described.

08

NAP unified, hours contradiction resolved SITE DONE · PROFILE PENDING

The name is now **The Cowork** everywhere — every "Hub" is gone from the codebase, the package name included. The address string had a chunk of Google Maps label glued onto the end of it in the footer; that is cleaned up. And the hours contradiction is resolved the way you described it: **open 24 hours** is the business fact, **reception 9 AM–8 PM** is the reply window, and both are stated in copy and modelled separately in schema.

```
src/data/site.ts ← single source of truth
BUSINESS_NAME    "The Cowork"
NAP.full         "95 College Road, PCSIR Staff Colony, Lahore 54770, Pakistan"
NAP.phone        "+92 333 4835258"
HOURS.access     "Open 24 hours, 7 days a week"
HOURS.recept     "Reception & inquiries: 9:00 AM - 8:00 PM, daily"
```

→ footer, every page, LocalBusiness schema and Organization schema all read from here

That file is the thing to protect. Change a price, the phone number or the hours in one place and the visible copy and the machine-readable markup move together — which is how the contradiction happened in the first place.

10

The H1 now says what people search FIXED

"Premium Coworking in Lahore" became "Coworking Space in Johar Town, Lahore" — the exact phrase you told me has driven your results historically. The elegant line survives as the sub-headline directly beneath it, so nothing was lost visually. That phrase now also carries the title tag, the meta description, the footer, the LocalBusiness description and the areaServed array.

I deliberately did *not* build a separate page for it. The homepage is the strongest URL on the domain and a second page targeting the same term would compete with it rather than help it.

11

Images, fonts and asset hygiene FIXED

Responsive WebP variants are generated for every photograph the site actually uses, and served through `srcset` at the size the layout needs. The relative `Images/WomanWorking.webp` path that would have broken on nested routes is absolute. Every image declares width and height; everything below the fold is lazy. The hero preload is scoped to the homepage only rather than firing on all fifteen pages.

PrivateOffice1.webp	450 KB → 18 KB at 400px, 53 KB at 800px
HotDesk1.webp	292 KB → 11 KB at 400px, 29 KB at 800px
Community1.webp	157 KB → 21 KB at 480px, 44 KB at 800px
Google Fonts	24 families requested → 2 actually used
Cache-Control	immutable, 1 year, on /assets and /Images

One thing I could not fix: your hero photograph is only 1264px wide at source, so it is still soft on large screens. That needs a higher-resolution original, which is a camera problem rather than a code one.

—

New pages that did not exist at all SHIPPED

Nine of the fifteen routes are new: `/pricing`, `/night-shift-coworking-lahore`, `/hot-desk-lahore`, `/dedicated-desk-lahore`, `/private-office-lahore`, `/meeting-rooms-lahore`, `/coworking-space-wapda-town`, `/coworking-space-pcsir` and `/faq`.

The two neighbourhood pages are written genuinely differently from each other — near-duplicate location pages get filtered by Google, so the Wapda Town page argues about the commute and the PCSIR page argues about being inside the society. Not the same page with the place name swapped.

09

Citations CANNOT BE FIXED IN CODE

Unchanged at 2 of 15, and honestly so. Local prominence is built from mentions of your business on other people's websites. There is no file I can edit that creates a listing on Coworker or gets you into Kickstart's "Top 14". The checklist is below.

What only you can do

17 POINTS · ROUGHLY FOUR WEEKS

In rough order of points-per-hour. Everything here is also in `SEO.md` in the repo, with the exact NAP block to paste.

☐ UP TO 8 POINTS · DO THIS FIRST

Get into the listicles that already outrank you

Kickstart's "Top 14 Coworking Spaces" and WorkPod's "12 Best Coworking Spaces in Lahore" both rank page one for your primary keyword today. Most publishers add spaces on request or for a nominal fee. Being *in* them is faster and cheaper than outranking them, and each one is a citation as well as a referral source.

☐ UP TO 5 POINTS

Twelve directory listings, identical NAP on each

Coworker, Office-Hub, Coworkingers, Instant Offices, HQ, Spaces Works, plus the Pakistani sites: b2c.com.pk, blogpakistan.pk, cubebell.com, launchboxpk.com, primecoworking.io, vsubletspaces.com. Paste the NAP block from `SEO.md` character for character — a near-miss is worse than no listing, because Google cannot merge the signals into one entity.

☐ 4 POINTS

Finish the Google Business Profile

Set hours to "Open 24 hours" with reception as secondary hours, so the profile agrees with the site. Add secondary categories (office space rental agency, business centre, virtual office rental). Add all three plans as Products at their real prices. Seed 10–15 Q&A entries — the questions are already written in `src/data/faqs.ts`, copy them straight across. Post weekly; your last post was May.

☐ ENABLES MEASUREMENT

Verify Search Console and submit the sitemap

There is currently no analytics or Search Console on the site, which is why the original audit had to be built entirely from the outside. Verify the property, submit `thecowork.pk/sitemap.xml`, then run URL Inspection on `/pricing` to confirm Google now sees rendered content. It will — the HTML is static.

☐ COMPOUNDS MONTHLY

Push review velocity, and get three named testimonials

87 reviews at 5.0 is the best rating in the radius; Venture Drive has 341 and volume is its own ranking factor. A QR code at reception and a WhatsApp follow-up in week two should get you 15–20 a month. Separately: no competitor in your radius combines a 4.7+ rating, published pricing, real FAQ content and named testimonials. You now have three of those four. Ask five members for a sentence and a company name and you have all of them.

☐ WEEK 10, NOT BEFORE

Then normalise the Google profile name

The profile currently reads "The Cowork – Coworking Space Johar Town Lahore", which breaks Google's naming rules and any competitor can file an edit against it. It was also carrying ranking weight the old site could not support. Now that the site has fifteen pages and full schema, let the rankings settle, then rename to **The Cowork** and let the site hold the keyword. Sequence matters here — do not do this in week one.

TWO THINGS TO ADD TO YOUR FACEBOOK AND SOCIAL PROFILES

Your Facebook page is at `facebook.com/ShareSpacepk` and displays a different name again. Rename the page to **The Cowork**; the URL slug can stay.

And send me — or add to `SOCIAL` in `src/data/site.ts` — your real

Instagram and LinkedIn URLs. I deliberately left them out rather than guess,

because those URLs are published as schema.org JSON-LD and are pointing at

because those URLs are published as schema.org SameAs and one pointing at a dead profile is a negative signal.

Before you deploy

- **The build is now three steps.** `npm run build` runs the client build, then an SSR build, then the prerender. Deploying the output of a bare `vite build` would ship the empty shell again. The script in `package.json` already chains all three — just make sure your Vercel build command is `npm run build`.
- **Adding a page later?** It must go in three places: `src/data/routes.ts`, `src/data/meta.ts` and `src/App.tsx`. Miss the first and it ships as a client-only route with no static HTML and no sitemap entry — silently.
- **Changing a price, the address or the hours?** Only in `src/data/site.ts`. Everything visible and everything machine-readable reads from that one file.
- **The work is not committed.** It is sitting in your working tree on `main`, ready to review. Say the word and I will branch and commit it.

Once it is live, re-run URL Inspection on two or three pages and confirm the rendered HTML matches the source. Then the citation work starts paying, and the score moves without anyone touching the code again.

Scored against the same weighted rubric as the 1 September baseline audit, so the two numbers are directly comparable. Page counts, word counts and schema types are measured from the actual production build output, not estimated. The 96 ceiling assumes the six tasks above are completed and indexed; citation and review effects take four to eight weeks to appear in ranking.
