

The Cowork — SEO Operations Handbook

Comprehensive roadmap for local search dominance, Google Business Profile management, citation building, reviews, and codebase health integrity.

The Cowork — SEO operations

The website half of the September 2026 teardown is implemented. This file covers the half that lives outside the codebase, plus the rules that keep the site half from drifting.

1. The canonical NAP block

Copy this **character for character** onto every directory, listing and profile. Inconsistency here is the single most common cause of a local business failing to rank.

Name: The Cowork
Address: 95 College Road, PCSIR Staff Colony, Lahore 54770, Pakistan
Phone: +92 333 4835258
Email: thecoworkpk@gmail.com
Website: https://thecowork.pk
Hours: Open 24 hours, 7 days a week (reception staffed 9:00 AM - 8:00 PM)
Category: Coworking space

Never publish "The Cowork Hub" or any keyword-stuffed variant. The source of truth is `src/data/site.ts` — change it there and the whole site plus every schema.org block follows.

2. Google Business Profile — do these in order

The profile is the single strongest asset the business has. It is also the biggest remaining scoring gap, and none of it can be done from the codebase.

1. **Reconcile the hours.** Set "Open 24 hours" for all seven days. Add reception hours as "More hours" → the site and the schema now both say the same thing.
2. **Add secondary categories:** Office space rental agency · Business centre · Virtual office rental · Meeting room rental. Primary stays *Coworking space*.
3. **Add Products with prices**, matching the published rate card exactly: Hot Desk PKR 15,000/mo · Dedicated Desk PKR 25,000/mo · Private Office from PKR 60,000/mo. Link each one to its page (`/hot-desk-lahore` ,

`/dedicated-desk-lahore` , `/private-office-lahore`).

4. **Add Services:** night shift coworking, meeting room hire, virtual office / business address, private office rental, dedicated desks, hot desks.
 5. **Seed 10–15 Q&A entries yourself** — use the questions from `src/data/faqs.ts` verbatim. They are already written and already match the site copy.
 6. **Post weekly.** The last post was May. A photo and two sentences is enough; the signal is frequency, not craft.
 7. **Do NOT normalise the profile name yet.** It currently reads "The Cowork – Coworking Space Johar Town Lahore", which breaks Google's naming rules and is suspension-eligible — but it is also carrying ranking weight the site could not previously support. Now that the site has 15 indexable pages and full schema, revisit this at ~week 10: rename to **The Cowork** once rankings hold on the site's own strength.
-

3. Citations — the biggest remaining scoring gap

Local "prominence" is built from mentions across the web. The site currently has almost none. Every row below either outranks thecowork.pk for the primary keyword today or feeds the directories that do. Use the exact NAP block above on each.

Coworking directories

- ☐ coworker.com
- ☐ office-hub.com
- ☐ coworkingers.com
- ☐ instantoffices.com
- ☐ hq.com
- ☐ spacesworks.com

Pakistani business directories

- ☐ b2c.com.pk
- ☐ blogpakistan.pk
- ☐ cubebell.com
- ☐ launchboxpk.com
- ☐ primecoworking.io
- ☐ vsubletspaces.com

Listicles — fastest wins available

These already rank page-one for "coworking space Johar Town Lahore". Being *in* them is faster and cheaper than outranking them. Most add spaces on request or for a nominal fee. - [] kickstart.pk — "Top 14 Coworking Spaces" - [] workpod.pk — "12 Best Coworking Spaces in Lahore"

Social profiles

- ☐ Facebook — currently `facebook.com/ShareSpacepk` ; **rename the page to "The Cowork"** so it matches the NAP block. The URL slug can stay; the display name is what matters.
- ☐ Instagram — add the real profile URL to `SOCIAL` in `src/data/site.ts`
- ☐ LinkedIn — add the real company page URL to `SOCIAL` in `src/data/site.ts`

Only Facebook is currently emitted, because it is the only URL that was verified. `SOCIAL` feeds both the footer icons and the schema.org `sameAs` array, so adding a key there lights up both at once — and until a URL is added, nothing points at a 404.

4. Reviews

87 reviews at a perfect 5.0 is the best rating in the radius, but Venture Drive has 341. Volume is a ranking factor in its own right.

- Put a QR code at reception linking straight to the Google review form.
- Send a WhatsApp follow-up in week two of a new membership.
- Target 15–20 new reviews a month.
- Ask five long-standing members for a **named testimonial with a company name** — no competitor in the radius combines a 4.7+ rating, published pricing, FAQ content *and* named testimonials. We now have three of the four. Testimonials are the last one.

Do not add `aggregateRating` to the site's schema. Google's guidelines prohibit marking up review data collected on a third-party platform, and a manual action here would cost far more than the rich-result stars are worth.

5. Measurement — set this up first

There is currently no analytics or Search Console on the site, which is why the original audit had to be built entirely from the outside.

- ☐ Verify **Google Search Console** (DNS or HTML tag) and submit `https://thecowork.pk/sitemap.xml`
 - ☐ Use **URL Inspection** on `/pricing` and `/night-shift-coworking-lahore` to confirm Google now sees rendered content (it should — the HTML is static)
 - ☐ Add **Google Analytics 4** or Plausible
 - ☐ Re-check the "Coverage" report in two weeks — all 15 URLs should be indexed, zero 404s
-

6. Where the SEO copy lives, and why it's collapsed

Most of the long-form copy sits in closed `<details>` rows rendered by `src/components/Details.tsx` (`<Disclosure>` inside a `<DetailPanel>`), near the foot of each page. The FAQ blocks use the same component.

This is deliberate, and it is not cloaking. The distinction matters:

TECHNIQUE	INDEXED?	SAFE?
Content in <code><details></code> / accordions	Yes, fully weighted	✅ Google's stated position since mobile-first indexing
<code>display:none</code> on keyword text	Yes, but flagged	❌ Cloaking — manual action, deindexing
White-on-white text, <code>text-indent:-9999px</code> , off-screen positioning	—	❌ Cloaking

The prerenderer (`scripts/prerender.mjs`) also strips the `opacity:0` that framer-motion writes into its `initial` state, so no prerendered page ships text a non-JS crawler would read as hidden. If you ever find `opacity:0` inside `<div id="root">` in a built page, something has regressed — fix it before deploying.

Never replace a `<Disclosure>` with a CSS-hidden block to "clean up" a page. If a page feels too heavy, close more rows or move copy to a different page — do not hide it.

7. Google reviews on the homepage

The homepage carries a Google-reviews carousel after the "Designed for Focus" section, driven by **Trustindex** — the same service workpod.pk uses (`cdn.trustindex.io`).

Turning it on

1. Sign up at trustindex.io and connect the Google Business Profile.
2. Create a widget. Set the layout to **slider / carousel, 3 per row** — the theme CSS assumes that.
3. On "Get the code" you get an embed like `<script src="https://cdn.trustindex.io/loader.js?abc123def">`. The part **after the ?** is the widget ID.
4. Set it as `VITE_TRUSTINDEX_WIDGET_ID` in Vercel's environment variables (and in `.env` locally), then redeploy. It is a build-time variable, so a redeploy is required — changing it in the Vercel dashboard alone does nothing until the next build.

Until that variable is set, the section does not render at all.

What it costs you

Trustindex renders **client-side**, so the reviews are not in the prerendered HTML. They are invisible to non-JS crawlers, link scrapers and AI crawlers, and sit in Google's deferred render queue. They add social proof for human visitors but **no indexable content** — unlike the rest of the site. The rating summary above the widget ("Rated 5.0 on Google · 87 reviews") *is* prerendered, so that much is indexable.

If you later want the reviews themselves indexable, paste real ones into `src/data/reviews.ts` and unset `VITE_TRUSTINDEX_WIDGET_ID`; the prerendered fallback carousel in `src/components/ReviewsCarousel.tsx` takes over. That fallback also kicks in automatically if an ad-blocker blocks the Trustindex script, so the section is never an empty frame.

Two hard rules

- **Never invent a review, a name or a rating.** `src/data/reviews.ts` must contain only real reviews copied verbatim from the profile. Fabricated social proof is deceptive, and on a business whose main advantage is a genuine 5.0 it is the most damaging thing to be caught doing.
- **Do not add `Review` or `aggregateRating` schema for these.** Google's guidelines prohibit marking up review data collected on a third-party platform. Displaying them is fine; claiming them as first-party structured data risks a manual action. This is why the schema graph has no `aggregateRating` despite the 5.0.

Theming

`src/index.css` carries `.trustindex-holder .ti-widget` overrides that pull the widget onto the dark/gold theme — glass cards, `#D4AF37` stars, gold-on-hover arrows, and the widget's own duplicate header/footer hidden. If Trustindex changes its class names in a future release the widget will revert to its default light styling; the fix is to update those selectors.

8. Rules for keeping the site half healthy

- **Adding a page?** Add it to `src/data/routes.ts` and `src/data/meta.ts` and `src/App.tsx`. The sitemap and prerenderer both read `routes.ts`, so a page missing from it silently ships as a client-only route with no static HTML.
 - **Changing a price, the address, the phone number or the hours?** Change it in `src/data/site.ts` only. Every page, the footer and all schema read from there.
 - **Never hardcode a price in page copy** without also updating `site.ts` — the JSON-LD `Offer` and the visible number must agree or Google treats the markup as untrustworthy.
 - **`npm run build` is now three steps** (client build → SSR build → prerender). Deploying the output of `vite build` alone ships an empty shell again. Vercel's build command must be `npm run build`.
 - **Don't touch the visual layout casually.** `Section.tsx`, `Navigation.tsx` and the page hero/card structures are the original, carefully-crafted design, restored verbatim from git. Add copy through `<Disclosure>` rows, not by expanding visible blocks.
-

9. Keyword targets

PRIORITY	TERM	PAGE
THE PRIZE	coworking space johar town lahore	/ (homepage — do not split this onto a second page)
HIGH INTENT	coworking space price lahore	/pricing
UNCONTESTED	night shift coworking space lahore · 24/7 coworking space lahore · coworking space for us timings lahore	/night-shift-coworking-lahore
COMMERCIAL	private office for rent johar town · dedicated desk lahore rate · hot desk lahore	plan pages
OWN IT NOW	coworking space wapda town · coworking space pcsir · coworking space college road lahore	neighbourhood pages
TRANSACTIONAL	meeting room rent johar town	/meeting-rooms-lahore

coworking space johar town lahore is the term that has historically driven results. It is the homepage <title>, the homepage <h1>, the meta description, the footer, the LocalBusiness description and the areaServed schema. **Do not create a separate page for it** — that would cannibalise the homepage, which is the strongest URL on the domain.
